

ReSIDS — two-tier detection: known attacks (k-of-n) + zero-day (anomaly)

1 • Detection — two tiers

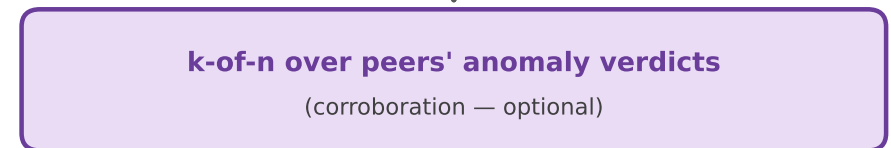

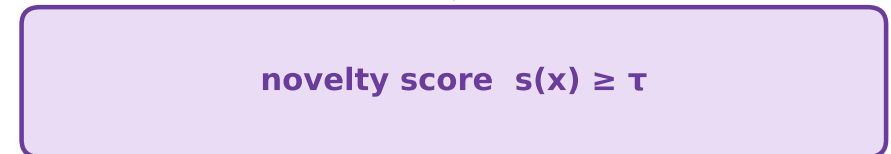

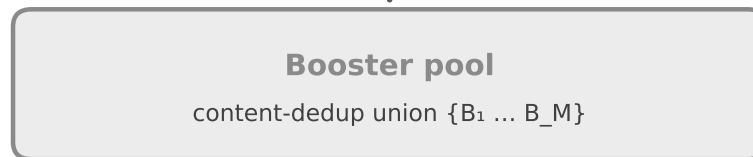

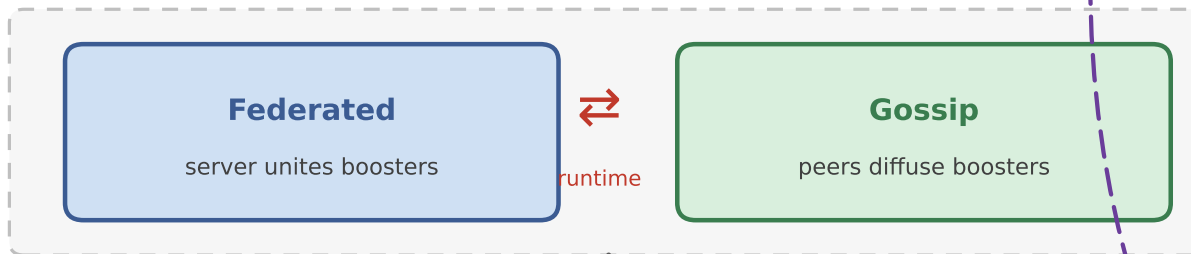

Tier 1 — attack specialists (supervised)

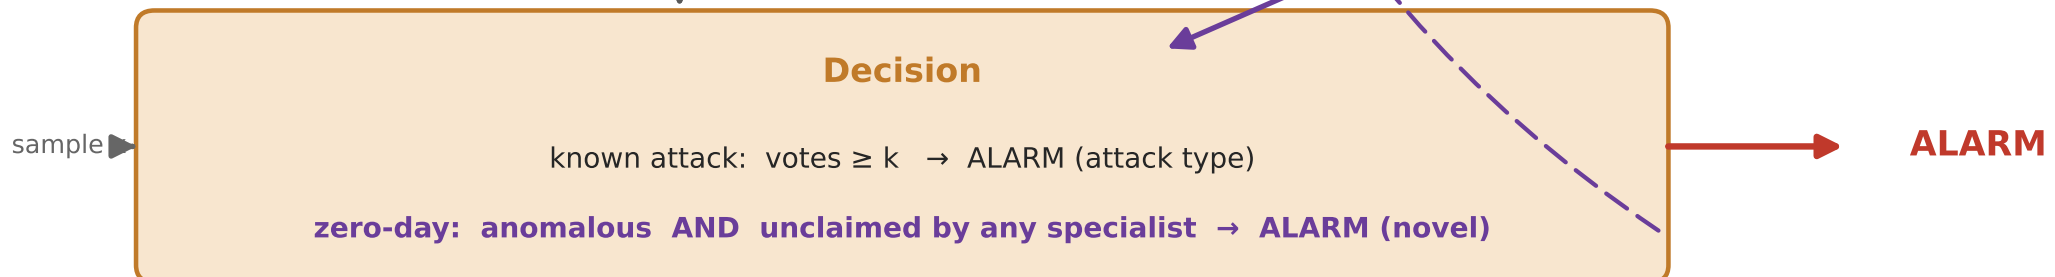

Tier 2 — zero-day detector (unsupervised)

2 • Aggregation & scoring

3 • Decision — two-tier

Tier 1 (supervised, known attacks; FL = GL under OR, runtime switch) + Tier 2 (unsupervised, benign-only, zero-day).

A novel alarm graduates to a specialist once labelled, then diffuses via FL/GL.
